

BEYOND ONE BILLION ELECTRIC VEHICLES BY 2050
STRATEGIES FOR LARGE-SCALE EV DEPLOYMENT

CHRISTINA CHANG – HEJC – 3/20/2017

PRESENTATION STRUCTURE

An aerial, high-angle photograph of a multi-lane highway filled with traffic. The scene is dominated by a dense flow of cars and several motorcycles. The image has a strong blue color cast, giving it a monochromatic, somewhat desaturated appearance. The vehicles are spread across the lanes, moving away from the viewer. The overall impression is one of a busy, congested roadway.

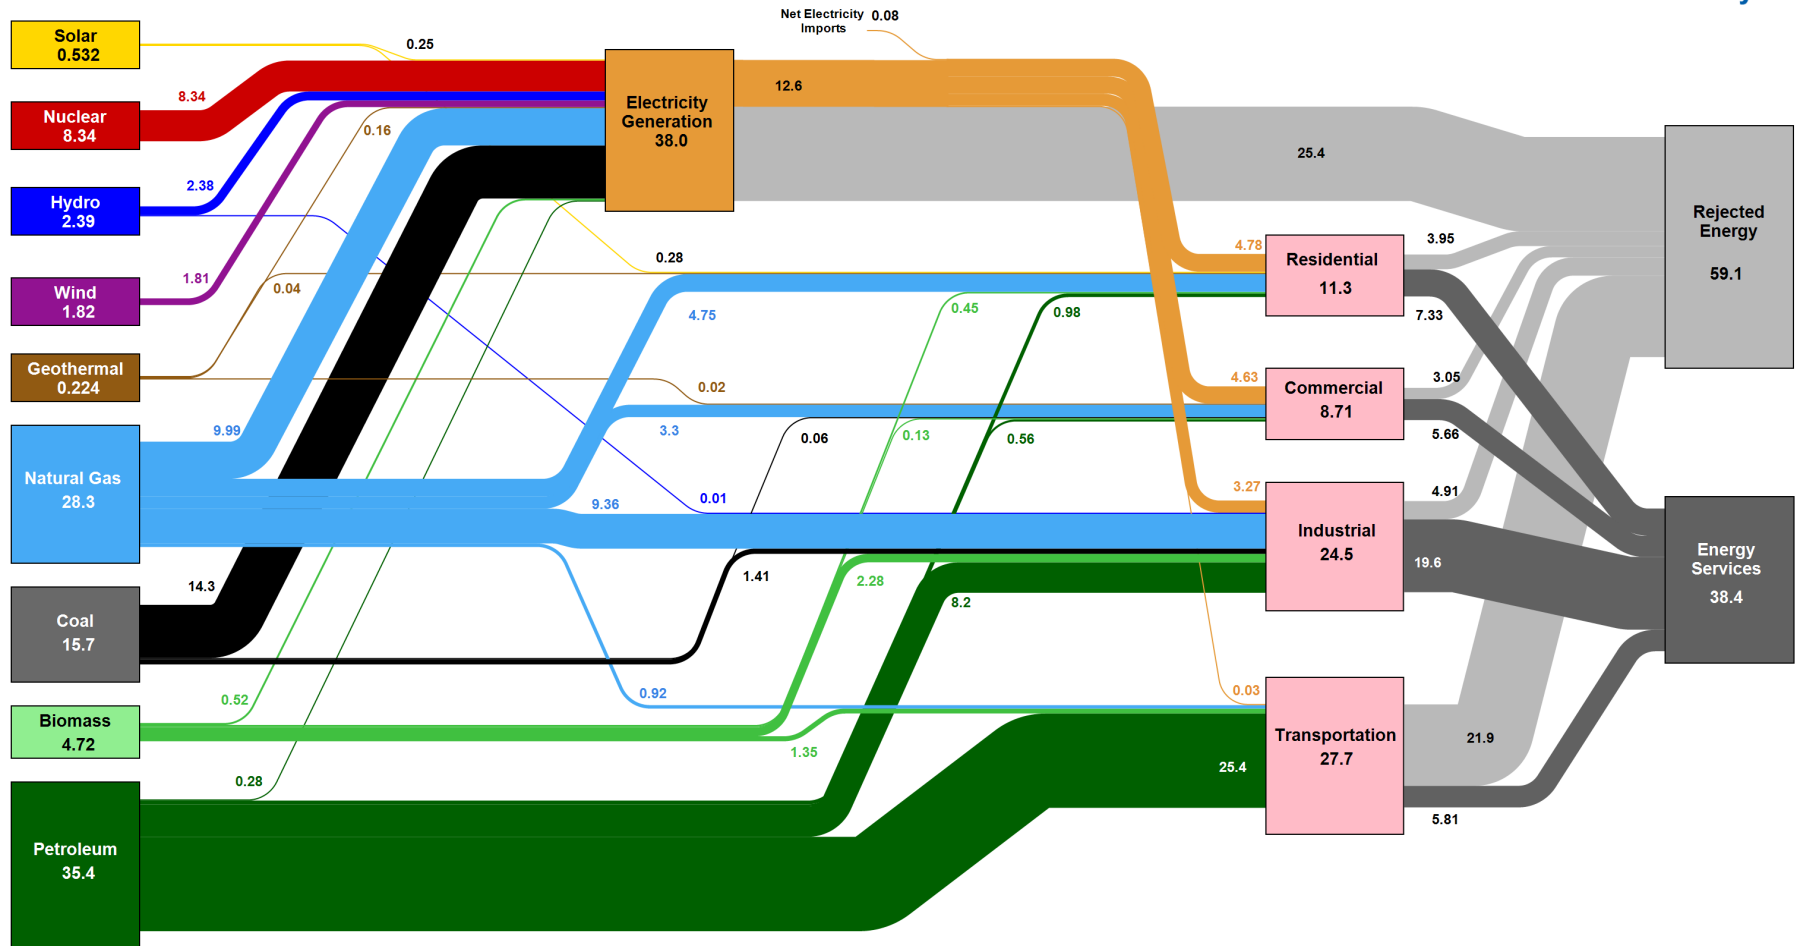

1. Context

How the U.S. can achieve an 83% reduction in CO₂ emissions relative to 2005 by 2050?

Which CO₂ polluter is hardest to mitigate?

Transportation is 26% efficient and is 92% oil-powered.

Estimated U.S. Energy Consumption in 2015: 97.5 Quads

Source: LLNL March, 2016. Data is based on DOE/EIA MER (2015). If this information or a reproduction of it is used, credit must be given to the Lawrence Livermore National Laboratory and the Department of Energy, under whose auspices the work was performed. Distributed electricity represents only retail electricity sales and does not include self-generation. EIA reports consumption of renewable resources (i.e., hydro, wind, geothermal and solar) for electricity in BTU-equivalent values by assuming a typical fossil fuel plant heat rate. The efficiency of electricity production is calculated as the total retail electricity delivered divided by the primary energy input into electricity generation. End use efficiency is estimated as 65% for the residential sector, 65% for the commercial sector, 80% for the industrial sector, and 21% for the transportation sector. Totals may not equal sum of components due to independent Rounding. LLNL-MI-410527

Passenger vehicles are the largest piece of the transportation pie and the easiest to electrify

Caveat: We should switch to public transportation as much as possible eventually, but this cannot all be built by 2050.

How much can we decrease energy use by cars?

$$\text{Power} = \frac{1}{2} \frac{m_c v^3}{d} + \frac{1}{2} \rho A v^3$$

distance driven before braking (pointing to d)

air density (pointing to ρ)

Term 1 dominates for city driving (<0.47 mi before braking).

We must reduce m_c and v .

How much can we decrease the mass of cars?

How many electric vehicles will we need, and how much energy will they require?

Assumptions:

- BAU: car-miles traveled increases 42% by 2050
- All cars are 3,000 lbs
- 10% reduction from BAU due to ride sharing and public transportation
- ICE is 18% efficient (true today)
- Electric motor is 80% efficient (true today)

US: 256M ICE cars 360M EVs

World: 809M ICE cars > 1B EVs

BMW i3
Mitsubishi MiEV
Chevrolet Spark EV

The EV Market is growing ever more rapidly

Figure 1 • Evolution of the global electric car stock, 2010-15

Note: the EV stock shown here is primarily estimated on the basis of cumulative sales since 2005.

Sources: IEA analysis based on EVI country submissions, complemented by EAFO (2016), IHS Polk (2014), MarkLines (2016), ACEA (2016a), EEA (2015) and IA-HEV (2015).

Key point • The electric car stock has been growing since 2010, with a BEV uptake slightly ahead of PHEV uptake. 80% of the electric cars on road worldwide are located in the United States, China, Japan, the Netherlands and Norway.

...Still, 1 billion EVs by 2050 would be off-the-charts

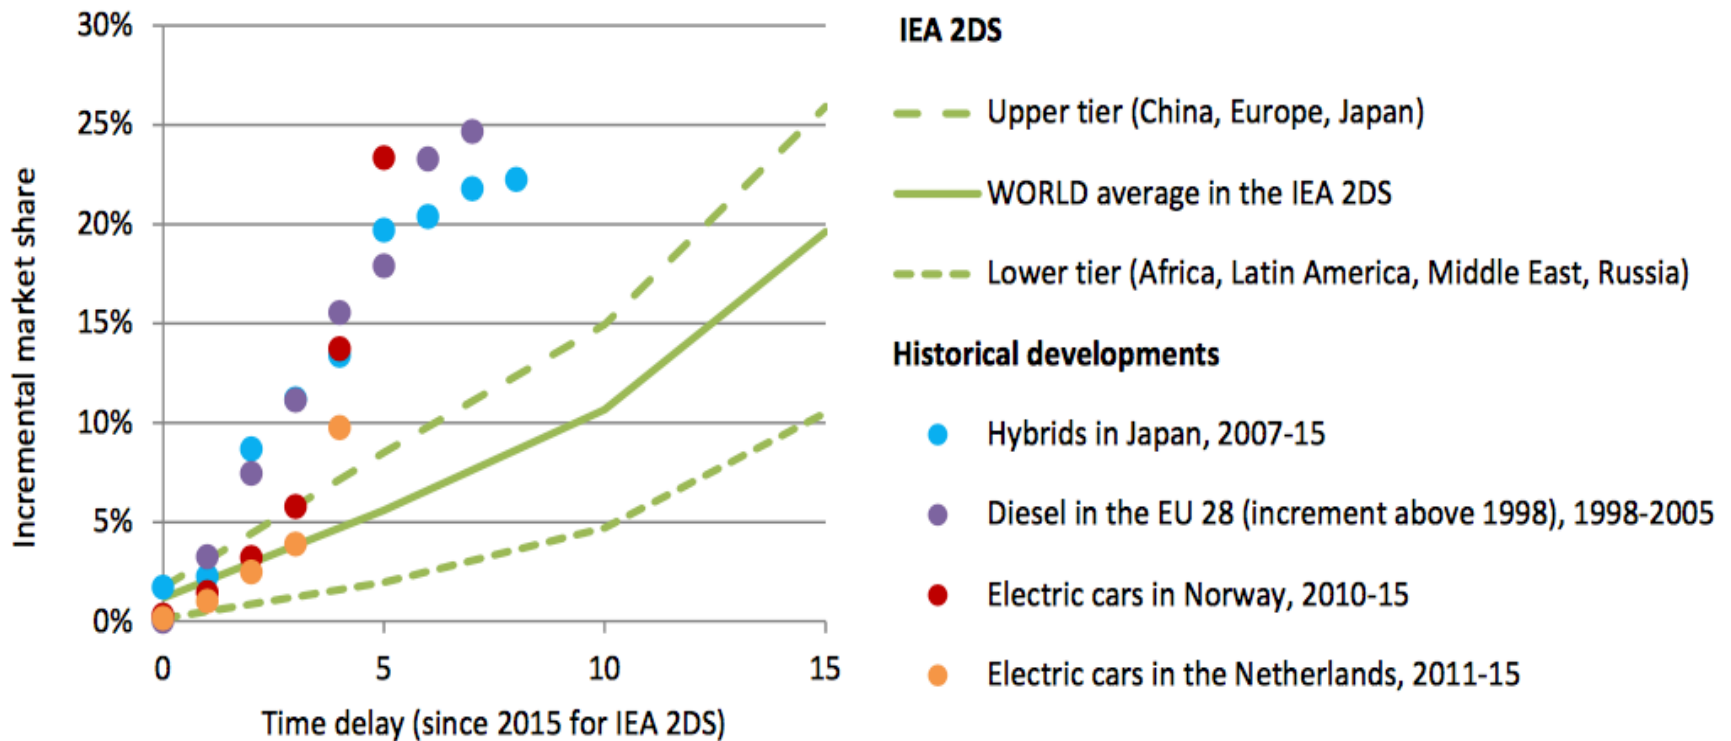

Sources: Data compiled by Bloomberg New Energy Finance, Marklines

Some countries are on track for fast adoption

Japan, Norway, The Netherlands

Figure 10 • Market penetration for electric cars needed to meet the IEA 2DS target compared with a selection of significant historical transformations in powertrain technologies

Sources: IEA analysis based on IEA (2016b), ACEA (2016b), Eurostat (2016), IHS Polk (2014) and MarkLines (2015).

3. Challenges & Solutions

3. Challenges & Solutions

Are we there yet?

\$!#%\$!

Consumer confidence

High cost of PEVs

Limited charging infrastructure

How expensive are PEVs?

2017 BMW i3

\$43,395

81-114 miles

2017 Chevy Bolt

\$37,495

238 miles

2017 Nissan Leaf

\$31,545

107 miles

2017 Tesla Model S

\$69,200 to \$135,700

210-315 miles

How expensive are PEVs?

Sources: https://www.iea.org/publications/freepublications/publication/Global_EV_Outlook_2016.pdf, US DOE (2015 and 2016) for PHEV battery cost and energy density estimates; EV Obsession (2015); and HybridCARS (2015)

Increasing fiscal incentives increases EV share of new vehicles

NORWAY CASE STUDY:

EVs already have 5% market share in Norway. In 2016, 37% of new cars sold were EVs. How has Norway achieved this high EV penetration?

BMW i3

#2
selling car last month

Policies

Tax & Toll Exemption
Bus Lanes & **Free** Parking
7,632 Charging points
Home charger incentive

Norway

Population 5.2 million

High GDP per capita

Electricity mostly hydropower

Similar to the USA:

- Sparsely populated
- Approximately 80% people live in urban areas
- 90% of passenger-miles traveled by car

Norway

Population 5.2 million

High GDP per capita

Electricity mostly hydropower

Of new vehicles:

12.6% are BEVs

1.2% are PHEVs

Of all existing vehicles:

5% are EVs

Fast DC charging stations in Nebbenes, Norway

Electric car rally in Geiranger, Norway

Electric car rally in Geiranger, Norway

Norway government fleets transition to PEVs

Police vehicles

Public buses

Private cabs

Public taxis

Oslo

Highest EV density of any capital

Goal: climate neutral by 2050

Pop: 650,733

Charging points: 1,820

Registered EVs: 12,000

How have they achieved this?

- Paid ~1.9 million euros for 400 charging stations between 2008-2011
- Collaborates in Europe-wide urban EV project (exchange knowledge)
- Public-private partnership for car sharing: Statkraft (publically owned energy utility) sponsors Move About (car sharing company)

EV Parade for AI Gore and IPCC Chairman Rajendra Pachaur

Make public investments in R&D

DOE's EV Everywhere aims to increase the adoption and use of PEVs

Vehicle Weight Reduction

Reduce vehicle weight by nearly 30%

(Includes body, chassis, interior, electric drive components, and compounding weight reductions)

Electric Drive System

Reduce cost from \$30/kW in 2012 to \$8/kW
(1.4 kW/kg, 4 kW/L, 94% efficiency)

Battery

Reduce cost from \$500/kWh in 2012 to \$125/kWh
(250 Wh/kg, 400 Wh/L, 2 kW/kg)

Support supply chain development

With more research and incentives, we can break our dependence on oil with biofuels, and become the first country to have a million electric vehicles on the road by 2015

Recovery Act

Loans to EV factories

Grants to support OEM factories

22,000 charging stations

CAFE standards

Are we there yet?

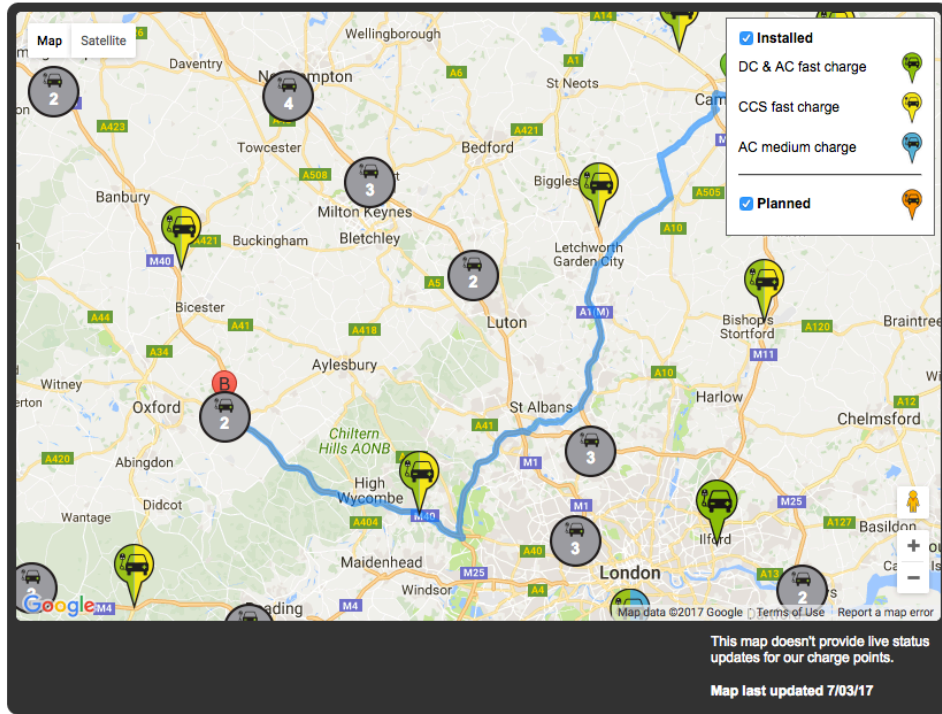

Limited charging infrastructure

Japan has more charging stations than gas stations

4 companies partner with Japanese government install 8,000 normal chargers and 4,000 quick chargers (expanding # chargers more than 2x)

- Japan has third largest EV fleet in the world, yet has stopped investing in EVs as heavily
- Government has decided to try to transition to hydrogen economy with fuel cell vehicles

Summary of Solutions

Develop a consumer education plan
Establish public demonstration of PEVs

Invest in chargers in public spaces
Provide incentives for installing chargers
Collaborate with private charging station providers
Streamline local zoning and permitting
Disseminate information on charger locations

!\$#%\$!

Consumer confidence

Are we there yet?

High cost of PEVs

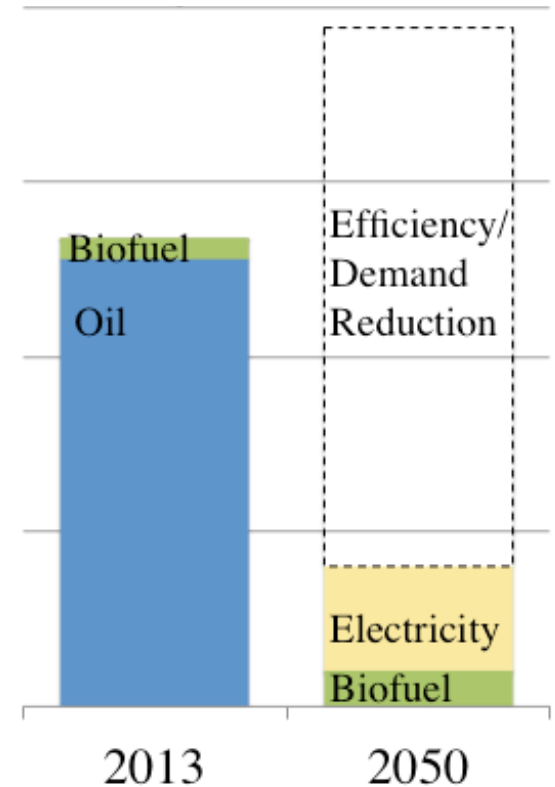

Limited charging infrastructure

Demand side strategies
provide financial & non-financial incentives
encourage utility rate discounts
transition government fleets to PEVs

Supply side strategies
make public investments in R&D
create tailored workforce training programs
support supply chain development & financing

One billion electric vehicles...

- Means all cars are electric
- Will be enabled by policy
- Will be enabled by steep increase in electricity production

US: 256M ICE cars 360M EVs

World: 809M ICE cars > 1B EVs

BEYOND ONE BILLION ELECTRIC VEHICLES BY 2050
STRATEGIES FOR LARGE-SCALE EV DEPLOYMENT
